

## CLAIMS (Amended)

1. (Amended) An organic EL display, comprising:  
a first translucent substrate;  
an organic EL element provided on said first translucent  
substrate and formed by layering an anode, a photoemissive  
layer formed from a plurality of organic substances, and  
a cathode; and,  
a second translucent substrate which seals said organic EL  
element; and characterized in that

said second translucent substrate has a depression at a site  
corresponding to said organic EL element on the surface  
opposing said organic EL element, and the distance between  
the lower surface of said first translucent substrate and  
the upper surface of said second translucent substrate is  
substantially constant across the entire surface of said  
first translucent substrate.

2. (No amendments) The organic EL display according to  
Claim 1, characterized in that said first and second  
translucent substrates are formed from glass.

3. (Amended) An organic EL display, comprising:  
a first translucent substrate;  
an organic EL element, provided on top of said first  
translucent substrate, and formed by layering an anode, a  
photoemissive layer formed from a plurality of organic  
substances, and a cathode;  
a second translucent substrate, provided on top of said

first translucent substrate, and in which is formed  
an aperture to accommodate said organic EL element;  
and,

5 a third translucent substrate, provided on top of said  
second translucent substrate; and characterized in that  
the distance between the lower surface of said first  
translucent substrate and the upper surface of said third  
translucent substrate is substantially constant across the  
entire surface of said first translucent substrate.

10 4. (Amended) The organic EL display according to Claim  
3, characterized in that said first, second and third  
translucent substrates are formed from glass.

5. (Amended) An organic EL element aggregation,  
comprising:

15 a first translucent substrate;  
a plurality of organic EL elements, provided on top of said  
first translucent substrate, and formed by layering an  
anode, a photoemissive layer formed from a plurality of  
organic substances, and a cathode; and,

20 a second translucent substrate, comprising depressions at  
sites corresponding to said plurality of organic EL  
elements, and which seals each of said organic EL elements;  
and characterized in that

25 the distance between the lower surface of said first  
translucent substrate and the upper surface of said second  
translucent substrate is substantially constant across the

entire surface of said first translucent substrate.

6. (Amended) The organic EL element aggregation according to Claim 5, characterized in that said first and second translucent substrates are formed from glass.

5 7. (Amended) An organic EL display, comprising:  
a first translucent substrate;  
an organic EL element, provided on top of said first translucent substrate, and formed by layering an anode, a photoemissive layer formed from a plurality of organic  
10 substances, and a cathode;  
a second translucent substrate, provided on top of said first translucent substrate, and in which is formed an aperture to accommodate said organic EL element; and,  
a third translucent substrate, provided on top of said  
15 second translucent substrate; and characterized in that the distance between the lower surface of said first translucent substrate and the upper surface of said third translucent substrate is substantially constant across the entire surface of said first translucent substrate.

20 8. (Amended) The organic EL element aggregation according to Claim 7, characterized in that said first, second and third translucent substrates are formed from glass.

25 9. (Amended) A method of manufacture of organic EL displays, comprising:  
an organic EL element disposition process, in which a

plurality of organic EL elements, formed by layering  
an anode, a photoemissive layer formed from a  
plurality of organic substances, and a cathode, are  
disposed on a first translucent substrate, the bottom  
5 surface of which is flat;

a depression formation process, in which depressions are  
formed at sites corresponding to each of said organic EL  
elements on a second translucent substrate, the upper  
surface of which is flat;

10 a first organic EL element aggregation formation process,  
in which an organic EL element aggregation is formed by  
bonding said first and second translucent substrates  
together, such that said organic EL elements face said  
depressions; and,

15 a division process, in which said organic EL element  
aggregation is cut and divided, together with said first  
and second translucent substrates, into individual organic  
EL elements.

10. The method of manufacture of organic EL displays  
20 according to Claim 9, characterized in that said depression  
formation process comprises:

a masking process, in which sites on the other said  
translucent substrate other than sites at which said  
depressions are to be formed are masked; and,

25 a first etching process, in which said masked translucent  
substrate is etched.

11. The method of manufacture of organic EL displays according to Claim 10, further comprising a second etching process in which at least one end face of said organic EL element aggregation is etched.

5 12. (Amended) A method of manufacture of organic EL displays, comprising:

an organic EL element disposition process, in which a plurality of organic EL elements, formed by layering an anode, a photoemissive layer formed from a plurality of organic substances, and a cathode, are disposed on a first translucent substrate, the bottom surface of which is flat; a bonding process, in which a second translucent substrate, in which are formed apertures at sites corresponding to each of said organic EL elements, is bonded to said first translucent substrate, such that each of said organic EL elements is accommodated by [each of] said corresponding apertures;

10  
15

an organic EL element aggregation formation process, in which an organic EL element aggregation is formed by bonding a third translucent substrate, formed in a sheet shape so as to seal each of said apertures, to said first translucent substrate; and,

20

a division process, in which said organic EL element aggregation is divided into individual organic EL elements by cutting and dividing said first, second, and third translucent substrates.

25

13. The method of manufacture of organic EL displays according to Claim 12, further comprising a first etching process in which at least one end face of said organic EL element aggregation is etched.

5 14. (Addition) An organic EL display, comprising:  
a first translucent substrate;  
an organic EL element, provided on top of said first translucent substrate, and formed by layering an anode, a photoemissive layer formed from a plurality of organic  
10 substances, and a cathode; and,  
a second translucent substrate which seals said organic EL element; and wherein  
said second translucent substrate has a depression at the site corresponding to said organic EL element in the surface  
15 opposing said organic EL element, and at least one end face of said first translucent substrate substantially coincides with at least one end face of said second translucent substrate in a direction perpendicular to the main surfaces of said first and second translucent  
20 substrates.

15 15. (Addition) An organic EL display, comprising:  
a first translucent substrate;  
an organic EL element, provided on top of said first translucent substrate, and formed by layering an anode, a  
25 photoemissive layer formed from a plurality of organic substances, and a cathode;

a second translucent substrate, provided on top of said first translucent substrate, and in which is formed an aperture to accommodate said organic EL element; and,

5 a third translucent substrate, provided on top of said second translucent substrate; and characterized in that at least one end face of said first translucent substrate, at least one end face of said second translucent substrate, and at least one end face of said third translucent  
10 substrate substantially coincide, in a direction perpendicular to the main surfaces of said first, second and third translucent substrates.

16. (Addition) An organic EL element aggregation, comprising:

15 a first translucent substrate;  
a plurality of organic EL elements, provided on top of said first translucent substrate, and formed by layering an anode, a photoemissive layer formed from a plurality of organic substances, and a cathode;  
20 a second translucent substrate, provided on top of said first translucent substrate, and in which are formed apertures to accommodate each of said organic EL elements; and,  
a third translucent substrate, provided on top of said  
25 second translucent substrate; and characterized in that one end face of said first translucent substrate, one end

face of said second translucent substrate, and one end  
face of said third translucent substrate  
substantially coincide, in a direction perpendicular to the  
main surfaces of said first and second translucent  
5 substrates.

17. (Addition) An organic EL element aggregation,  
comprising:

a first translucent substrate;

10 a plurality of organic EL elements, provided on top of said  
first translucent substrate, and formed by layering an  
anode, a photoemissive layer formed from a plurality of  
organic substances, and a cathode; and,

15 a second translucent substrate, comprising depressions at  
sites corresponding to each of said organic EL elements,  
and which seals each of said organic EL elements; and  
wherein

20 at least one end face of said first translucent substrate  
substantially coincides with at least one end face of said  
second translucent substrate in a direction perpendicular  
to the main surfaces of said first and second translucent  
substrates.
